Capture Screen

This section outlines the main shooting functions on the ProCamera capture screen.
Flash/Torch  Open EV-Dial View  Front/Back Camera

- Flash/Torch
- Open EV-Dial View
- Front/Back Camera

Lightbox/Camera Roll  Mode Switch  Main Shutter  Second Shutter  Control Panel

- Digital Zoom
- EXPOSURE
- FOCUS

Press the **Main Shutter** to take a photo. The screen will flash black to indicate a photo has been taken.

The **Second Shutter** can be set as either an Anti-Shake or Self-Timer through the Control Panel.

The **Mode Switch** function allows you to select different cameras including Photo, Video, HDR, Selfie, LowLight, LowLight Plus and Code Scanner.

The **Control Panel** provides one tap access to a range of advanced shooting controls.

The **Lightbox/Camera Roll** provides one click access to the Camera Roll or Lightbox.

Pressing on the **Flash** toggles between the Auto, On and Off settings. Performing a long tap on the Flash de/activates the **Torch**. A single tap on the torch icon deactivates the torch. Long tap the torch icon to switch between torch intensity slider or exposure and ISO display.

In HDR and LowLight Plus camera mode there is no flash available.
The Front/Rear Camera Switch is available on devices equipped with a front camera.

With a long tap on the Front/Rear Camera Switch you can mirror the preview in the viewfinder.

A single tap on the EV icon opens the exposure compensation slider. Exposure value is displayed. Another single tap closes the slider, while keeping the exposure compensation value.

A double tap on the exposure compensation slider closes it and resets the value.

The zoom factor is displayed on the Capture Screen. 1x means no magnification is active. When shooting with the Tele lens of the iPhone 7 Plus, the “unzoomed” starting position is 2x.

The Full-Resolution Zoom can be controlled in two ways:

1. Slide your finger over the semi-transparent zoom slider to adjust the level of magnification. The slider fades into the background when the zoom factor is 1x (to limit distractions when shooting).

2. Use the pinch gesture (two fingers) to zoom in and out (the zoom slider will appear).

With a single tap on the zoom factor, you can quickly jump back to the starting position (=no zoom).

This function can be turned on and off under the Photo Zoom option in the ProCamera Settings.
**Camera Mode Selector** does not only allow you to select different camera modes, but can also be customized. To change the camera mode, swipe left or right and tap on the desired mode.

---

To **Rearrange Camera Modes** press and move the modes according to personal preferences. You can even hide Camera Modes you rarely use.

The **Today Widget** displays the first five camera modes. If you rearrange camera modes those changes will be taken over in the Today Widget.

As with the ProCamera Widget, the order of the camera modes in the Camera Mode Selector determines which modes appear on your **Home Screen Quick Action List**. Via 3D touch on the app icon, you can directly launch ProCamera in a specific camera mode (available on iPhone 6s and later). The quick action list shows the first 4 modes from your Camera Mode Selector.
Focus and Exposure

This section explains how to set focus and exposure separately on the viewfinder, how to adjust exposure, ISO and color temperature, and how to shoot better photos.
You can set focus and exposure by tapping on the preview image, or by moving the control elements (square and circle) directly on the viewfinder. Additionally, you can use the new exposure sliders to brighten or darken your image or to manually set ISO and shutter speed values.
**Combined Focus and Exposure**

A single tap anywhere on the capture screen activates the combined Focus/Exposure point. This mode is great for quick and easy adjustments when shooting.

**Separate Focus and Exposure Points**

They can also be split by dragging one from the other. In the spot on the viewfinder where you locate the exposure circle, exposure is measured and adjusted optimally. Placing the focus square determines the point where your picture is focused. A long tap anywhere on the screen other than on these control elements resets the points to the centre.

**Lock and Unlock**

A long tap locks (shown with the small lock symbol) and unlocks either the Focus Square and Exposure Circle. This allows you to change and readjust what you see in the viewfinder without altering your settings of exposure and focus. Moving a locked focus or exposure control element causes another automatic metering and saving of the resulting value. The control element will be locked when adjustment has finished.
The **Focus and Exposure** option lets you customize your preferred behavior of focus and exposure tools.

If you wish to control exposure exclusively by using dials, you can turn off the **exposure control (yellow circle)**. Exposure is measured automatically and can be biased with the exposure compensation control. You can also set exposure manually with ISO and Shutter Speed controls. In HDR mode the exposure circle can be activated or deactivated independently from the general setting for ProCamera.

You can set the priority of exposure circle over focus square. In order to set focus first and adjust exposure afterwards, switch off **Exposure Priority** (which is the 'classic' setting).

Enable **Manual Focus** by activating this option. You can decide, whether this function is always active or if it has to be activated with a long tap on the focus reticle. This tool is in Public Beta stage. Check it out and let us know your feedback and suggestions via Settings > Customer Support. (More information on how it works on the next page.)

Enable **Show Focus Lens Position** to make it appear in the viewfinder. (see next page)
With Manual Focus enabled a long tap on the focus reticle toggles between autofocus and manual focus. If you set manual focus to “always active”, you can take over focus control anytime. Manual focus works in video mode as well. Thereby you can change the focal plane by gradually shifting focus during video recording.

**Lens Position Indicator**

The Lens Position Indicator lets you see when automatic focusing has finished, that is when the point on the slider stops moving. Particularly on older generation devices which do not have focus pixels and perform a slow focus scan, this is useful.

**Manual Focus** (Beta)

You can manually set focus by sliding your finger up and down on the viewfinder. Afterwards, without taking your finger off the screen, slide left/right to fine-tune focus. Fine-tuning only works when done as a sequence in this order.

1. **Focusing roughly**
   - Sliding your finger upwards: Focus towards infinity
   - Sliding your finger downwards: Focus towards object at close distance (Macro).

2. **Fine-tune focusing**
   - Keep your finger on the screen (don’t lift it off) and slide horizontally (left/right).
   - Give it a go, it’s easier than it sounds.
This section explains the different controls and functions in the ProCamera Control Panel.
The **Control Panel** is designed to provide one tap access to a range of advanced shooting controls.

**Tip**

Try tapping on all the functions and see what changes on the capture screen (for example the gridlines and aspect ratio).

The lens selection (Wide, Dual, Tele) is only available on the iPhone 7 Plus.
**Rapid Fire** mode allows you to shoot continuous, full-resolution shots in quick succession.

The **F/E Lock** sets the Exposure and Focus Points to lock on touch release (flashes briefly). Once locked, you can recompose your scene without changing the exposure level or focus distance.

Toggles between three **Grid** views (Small Grid, Rule of Thirds Grid and Golden Ratio) to assist with photo composition.

Turns on a virtual horizon 3D **Tiltmeter** to help straighten photos.

Turns on the Live **Histogram** which shows overall light levels as bars or squares. Red bars or squares indicate over (right) or under (left) exposure. The higher the bars or the more intense the red color of the squares, the more the image is over or under exposed.
When **White Balance (WB)** is enabled, an icon appears on the capture screen. Tap it to open a menu: You will see an indicator for color temperature (in Kelvin) and one for color tint. Tapping on either activates the corresponding slider at the bottom of the viewfinder. Your setting is saved until you activate Automatic White Balance by tapping the WB icon. This allows you to take a series of photos with the same color temperature and tint, or to compensate for too intensely orange colors in a sunset by sliding to a blue tint, e.g..

You can initiate a color calibration with a long tap on the **WB Lock** icon. Place a standardized grey card with a reflectance of 18% or 25% in front of your camera so it covers at least 50% of the viewfinder. Try to avoid shadows on the gray card. Then calibrate by long tapping WB Lock. Calibration is recommended when automatic white balance may not be properly functioning. This might occur with objects surrounded by a neutral palette (e.g. photos for advertisement purposes on white background). AWB can result in incorrect color values in such situations. If you don’t have a gray card at hand, street asphalt is a good approximation.
In **Manual mode** you can turn on **ISO and shutter speed** readings at the top of the viewfinder. Tapping one of them opens a slider at the bottom of the viewfinder for manual control. Slide or tap to set a value of your choice. In Manual Mode, you have full control over ISO and shutter speed. Once set, the camera will not adjust the values automatically anymore.

The **Semi-automatic mode** is all about control and speed, and is based on the interplay between shutter time and ISO value. According to the situation or your artistic needs, you can dial in a specific value for one of those two settings (shutter time & ISO) and ProCamera will do the rest, finding the appropriate value for the best possible exposure.

Manual Mode (M) and the semi-automatic SI Mode are not available, when shooting in Dual lens mode on the iPhone 7 Plus.

Toggles between six **Aspect Ratios**: Standard (4:3), 35mm film (3:2), Widescreen (16:9), Square (1:1), maximum aspect ratio of Instagram (5:4), Letterbox (3:1) and Golden Mean. A long tap displays all modes.

When shooting RAW photos, those files (.DNG) will be saved in the 4:3 aspect ratio of the camera sensor – regardless of the selected aspect ratio in the Control Panel.
Selecting **Anti-Shake** assigns it to the Second Shutter button (right of the Main Shutter). Anti-Shake will delay the shutter release until the iPhone is held steady, resulting in clearer and sharper photos. Movement detection is displayed onscreen by the small icon above the Main Shutter Button. When ProCamera’s Anti-Shake is active the Automatic Image Stabilization (AIS), which is provided by iOS and available on iPhone 5s and newer, is disabled.

Selecting **Self-Timer** in the Control Panel assigns it to the Second Shutter button (right of the Main Shutter). Pressing the Second Shutter activates the count-down, three beeps will signal the last seconds before the photo is taken. The timer duration can be adjusted within ProCamera’s Settings. A **Series of three** photos in a burst instead of a single Self-timer exposure may be activated at the same place.

Toggle between three levels of **On-Screen Display Modes** (Standard, Medium & Light) in order to hide non-critical display elements on the Capture Screen. (Medium display has previously been called Fullscreen Mode.) Focus and Exposure points remain unaffected regardless of the mode you choose. Standard mode provides complete control over all the display elements, whereas Light mode offers a more streamlined camera experience. All 3 modes work in conjunction with the various Aspect Ratios.
The File formats can be selected in two ways:

1.) A quick way to change/check the file format is opening the Control Panel. In the bottom left corner, the current file format is displayed. Tap on it to change the file format.

2.) Open Control Panel (three lines icon, bottom right) > Settings > Photo Mode Options: File format.

You can save photos in five file formats:
**TIFF:** Highest quality and largest file size.
**TIFF LZW:** TIFF format with lossless compression and smaller file size. Compression requires longer save times (up to 1 second per photo).
**JPEG:** The standard file format for Apple devices. JPEG compression results in lower photo quality and smaller file size.
**RAW (DNG):** Undeveloped photo, raw sensor data. RAW capture is supported on all devices with a 12 megapixel camera (iPhone 6S and newer)
**RAW + JPEG:** A separate JPEG file will be saved along with the RAW (.DNG) file. Deviating from the RAW file, the JPEG respects the selected aspect ratio and image stabilization may be applied.

We recommend using desktop software like Photoshop to develop your RAW files. Creative Cloud users can send a RAW file directly to Photoshop on the desktop from within ProCamera (Share-Menu)
Quickly switch between the wide and the tele lens of the iPhone 7 Plus. You will also feel the lens switch with haptic feedback.

How To:
Open Control Panel (three line icon, bottom right) > Tap „Tele“, „Dual“, or „Wide“ icon in the new Tool Selector.

In a dedicated article on blog. procamera-app.com, you can find a detailed examination of The Dual-Camera System Of The iPhone 7 Plus.
The **Settings** mode opens up the advanced ProCamera settings. The Photo options are explained below. “More” button at the top of the settings page to show/hide the full list of settings options.

Under **Settings > Stabilization** there are two options available:

- **The Anti-Shake slider** controls how steady the iPhone must be held before ProCamera takes the photo. Slider to the left: camera will snap a photo when the iPhone is completely stable - maximum shake protection. Slider to the right: will take a photo even if it is still a little shaky - minimum shake protection.

- **Automatic Image Stabilization (AIS):** On iPhone 5s and newer AIS is activated by default. With this settings option you can deactivate AIS, which will give you the maximum amount of detail in the photo, but might lead to motion blur caused by camera shake.

- Controls the **Self-Timer** length from 0.5 seconds to 20 seconds. You can use the lowest setting (0.5s) as another shake-preventing capture method.

- The **Series of three** setting takes three photos in a quick burst after the specified delay time. This setting helps you to minimize the risk of eye-blinks in selfies and in group shots. This is also one of the benefits of the ProTimer, which offers full customizability (see chapter 4).
The available file formats in ProCamera:

**RAW (DNG)**

**RAW + JPEG**

**TIFF**

**TIFF LZW**

**JPEG**: Via swipe dial, you can adjust the compression rate. A lower quality settings means stronger compression (= smaller file size), which will gradually lead to so-called JPEG artifacts, causing a loss of fine details.

File formats apply to photos captured and edited in ProCamera. Photo sizes and formats can change when uploading to social media. Please check with the respective social media providers for file and compression rates.

Turn on **Fullscreen Trigger** to tap anywhere on the viewfinder to instantly take a photo. The shutter will not fire if you press directly on either the focus or exposure points. Perform a long tap to set focus and exposure to the point of interest.

Turns the **Photo Zoom** on/off.

Turn on **Auto Save** to automatically save photos to your Camera Roll or Lightbox. Turn off Auto Save to see a preview after an image is taken where you can choose to save or discard the image.

The **Datestamp** adds the date and time to the bottom of the saved photo.
There are many possibilities to extend the creative controls in ProCamera. With our Remote Trigger for the Apple Watch and ProTimer you can remotely control your iPhone and take series of photos based on your specifications. Due to the ProCamera quick-launch widget and Home Screen Quick-Actions, you are ready to shoot in no time.
Today Widget - Sunrise & sunset times

The Notification Center, which is provided by Apple’s iOS, is your iPhone’s customizable repository for system and app notifications. To open it simply place your finger above the top of your screen and pull down — even when your lock screen is displayed.

How to add ProCamera as a Today View Widget:
The Today View can be customized via the Edit button at the bottom of your widget list (only visible when your iPhone is unlocked). By tapping the little green „+“ icon in front of the app name, you can add the ProCamera widget to your Today Screen.

How to use the ProCamera Widget:
The widget enables you to rapidly launch ProCamera, namely in one of the available camera modes. For example, if you plan to record a video, you are able to directly launch the app in Video Mode. To best support your specifications, the order of the Camera modes in the widget is the same as in the Camera Mode Selector of ProCamera. If you re-arrange the Camera Modes in the app, those changes will be carried over into the Widget. The widget displays the first 5 camera modes.

In addition to this, the widget displays the time of sunrise and sunset, next full moon, and the duration of the next blue hour for your current location.

Use the Today Widget Settings Option to individually show/hide these additional information in the widget.
ProTimer is an intervalometer. This extension of the already known Self-Timer provides you with new options to set a total number of photos as well as a pause between succeeding photos.

Make sure you have set the Self-Timer as your Second Shutter in the Control Panel (see chapter 3: Control Panel).

Long tap on the Second Shutter, in order to get access to the settings of the Self-Timer. Here you can adjust the delay time before the camera starts capturing. Tap on “Open ProTimer” to additionally set the total number of photos and the pause between succeeding photos.

ProTimer is not available in HDR, LowLight Plus and Selfie camera mode.
A tap on the Second Shutter closes the settings menu.

Another tap on the Second Shutter starts the Self-Timer or ProTimer. To stop the countdown or an ongoing capturing process, simply tap on the Second Shutter. To switch between Self-Timer and ProTimer tap on **Open ProTimer** and **Close ProTimer**. The respective settings are retained.

The icon of the Second Shutter indicates which Timer is active at the moment: The ProTimer icon includes the number of photos set.

![Self-Timer](attachment:Self-Timer.png) ![ProTimer](attachment:ProTimer.png)
The **ProCamera Remote Trigger** extension for Apple Watch lets you control ProCamera remotely. For this, ProCamera has to be running in the foreground.

You have the following options with the ProCamera Remote Trigger:

- Capture your moments in Photo, Video, HDR, LowLight and LowLight Plus modes
- Change capture formats
- Set the delay and total number of photos
- Preview the viewfinder on the Apple Watch
- View photos
vividHDR enables you to capture photos with a high dynamic range. This means more details in highlights and shadows even if your scene has a high contrast.

With auto-bracketing, three pictures are shot with different exposure settings which are then combined into one HDR image. The processing is so fast and precise, you can take photos without a tripod and capture scenes with objects in motion without ghosting.
What is real HDR imaging?
HDR images contain a greater range of light that is present in real-world scenes. Three or five photos are captured at different exposure levels, which are then combined into one with a higher level of color precision (aka higher dynamic range). A standard screen has a limited dynamic range that inadequately displays the full range of light intensities found in an HDR image. To address this issue, the contrast range is compressed with a technology called tone-mapping so the photo can be displayed on a standard non-HDR screen. vividHDR enables you to tweak the parameters of tone-mapping so that you can choose between a natural-looking image or one with exaggerated contrast for dramatic effects.

vividHDR in ProCamera
You can purchase vividHDR as a special extension to ProCamera. vividHDR in ProCamera combines the best HDR for iOS along with the professional feature set already found in ProCamera. To make sure you like it, you can try it out before buying it. In demo mode, your HDR photos will have a watermark that can’t be removed.
Take great HDR photos with ease in Auto-mode, or set manual exposure for each of the three individual photos which are taken in quick succession in HDR mode.

**Automatic HDR** mode analyzes the range of contrast for your subject in a two-step scene analysis. In this mode, optimal values are automatically set to capture both an under- and overexposed image of your subject. This intelligent scene analysis forms a crucial part of the quality of vividHDR, making it the go-to choice in most situations. Just set exposure and focus (or let the camera do this automatically), then tap the shutter button and hold your iPhone steady. ProCamera will take three shots in quick succession (Bracketing). A preview shows the results. The medium exposed photo (LDR-photo (Low-Dynamic-Range)) will be saved along with the HDR photo. You can deactivate saving the LDR photo or showing a preview via Settings > HDR Settings.

In full Auto mode, the results of the scene analysis determine whether the camera takes 3 or 5 photos. Toggle the Auto icon to manually set the number of photos (**Auto 3** or **Auto 5**). For scenes with very high contrast, 5 photos will yield better results. However, the total exposure time is longer when taking 5 photos, which means you need to hold the iPhone absolutely still. Both Auto 3 and Auto 5 use a two step scene analysis to determine the best exposure settings.

**LowLight HDR** captures HDR photos utilizing the maximum exposure time of your device, allowing for clearer night shots with lower noise levels. This mode is a special bonus for users that have purchased both vividHDR and **LowLight Plus**.
In **Manual Exposure Bracketing Mode (MEB)**, you determine the value of the medium exposure, as well as the range of contrast between over- and underexposure. In manual mode no two-step scene-analysis is performed, so it’s up to you to set the optimal values.

For under- and overexposure slide one of the red brackets and the other bracket will adjust symmetrically based on your setting. While moving a bracket, a magnifier helps you to fine-tune. Many users may already be familiar with this popular feature available with most DSLR cameras.

In **Advanced Manual Exposure Bracketing Mode (AMEB)** you have full control over exposure values of your HDR photos. As in Manual HDR Mode, you set the central exposure by moving the green mark on the dial. Underexposure is set by moving the orange bracket, overexposure by moving the blue bracket. Both settings work independently (asymmetrically).

While moving a bracket, the picture at the under- or overexposure you are setting is displayed in the viewfinder. Upon release of your finger, the viewfinder shows the picture at your central exposure setting. While moving a bracket, a magnifier helps you to fine-tune. An automatic two-step scene-analysis does not take place.

In this mode you can create artistic modifications or nuanced HDR effects. However, careful arranging of the settings is required, in order to achieve good results.
Choose how your HDR photo should look

After the HDR photo has been processed, you can choose one of five presets. In the control panel, you can select your preferred preset, which will then become the first preset shown in the HDR preview screen. The remaining four presets can be applied to your preview, just like in Filter Studio, by swiping to the left of the screen.

Now, you can select more than one HDR preset and save various versions of a single capture in one go. Simply swipe left and right to preview the different HDR presets, then tick off the ones you want to save.

A swipe to the right, as well as tapping your finger on the compare button in the center of the bottom tool bar, lets you compare your HDR photo to the medium exposure photo of your exposure bracket.
LowLight-Cameras

This section gives an overview of the LowLight-Modes available in ProCamera. When photographing in dark environments, the iPhone camera hardware quickly reaches its limits. With LowLight and Lowlight Plus, ProCamera provides powerful software solutions for this problem.

**Single photo or multi-frame capture**

LowLight mode (previously called Night mode) is an extension of the standard Photo mode. It allows you to take photos up to the device’s maximum exposure limit. With LowLight Plus mode, you can go beyond this limit and take photos even in extremely low light. The groundbreaking technology automatically combines multiple exposures (“multi-frame capture“) into one superior photo.

Back to table of contents
Night camera is now called LowLight camera

With this Night mode, very dark environments resulted in very dark photos. However, you could (and still can) take photos with this mode in relatively low light conditions. Therefore, we decided to call it LowLight mode.

How to Switch to LowLight Camera Mode

1. Select Mode Switch
2. Swipe left and tap to select LowLight Camera Mode
3. Open Control Panel to select shutter speed

There are three or four shutter speed options in the LowLight Control Panel.

The number of available exposure time options in the control panel depends on which iPhone generation you are using. Selecting one of those options means that the camera will set an exposure time up to this maximum value. If the scene you are shooting is too bright, the camera will choose a shorter exposure time to avoid overexposure. When shooting with long exposure times, an on-screen signal (tripod icon) will provide a warning if there is a risk of camera shake.

Tip It is recommended that the 1/2 sec and 1 sec speeds are used with a tripod to limit camera shake.
These icons will help you take shake-free photos.

- Use both hands to hold the iPhone as still as possible. Exposure times up to 1/8s.
- Use a tripod or your own creative stabilization method. The tripod icon will turn red if the iPhone detects too much camera shake.

By means of on-screen icons (top left), the **tripod detection** helps you find out if the iPhone is steady enough. When LUX+ is activated, a tripod icon is always displayed as this mode requires total stabilization. The tripod detection is very sensitive, and even detects slight ground vibrations (e.g. on a bridge) or shaking caused by wind.

- An important part of LowLight Plus is the **Hand-held Priority**, which allows you to capture noise-free photos with exposure times up to 1/8s without a tripod. By tapping the orange hands symbol (top left), you can switch to tripod mode even if the motion sensors detect too much camera shake. The icon then displays a rounded box around the tripod symbol, and the camera will utilize the maximum exposure time of your device. When forcing the camera to switch to tripod mode (and longer exposure times), the risk for blurry photos due to camera shake increases. By tapping the icon again, you will go back to Hand-held Priority and the orange hands symbol will be displayed.
LowLight Plus in ProCamera

The LowLight Plus module is available as an In-App Purchase in ProCamera. We offer you the ability to try LowLight Plus before making the purchase. The free trial mode is unrestricted in functionality. However, all LowLight Plus images will be saved with a permanent watermark, which cannot be removed. After you purchase LowLight Plus, there will be no watermarks added to any new photos you take.

3 potential applications of LowLight Plus

1. Noise Reduction – Hand-held
Now, you can take noise-free photos without a tripod using our revolutionary image alignment technology. Noise reduction is achieved by automatically combining multiple photos taken with exposure times up to 1/8s into one superior image.

2. Noise Reduction – Tripod Mode
When using a tripod, multiple photos are captured and combined into one superior photo using the device’s maximum exposure time. The iPhone’s motion sensors automatically detect whether the device is kept steady enough to capture photos at maximum exposure time. When stability has been achieved, the device will switch to tripod mode and display a tripod icon (top left) instead of the shaky hands symbol.

3. Long Exposure (LUX+) – Tripod Mode
By activating “LUX+”, you can now take photos even in very dark environments. Thanks to the powerful exposure boost, candlelight or moonlight will suffice as a light source. Using a tripod is mandatory, as LUX+ captures up to 64 separate images, and the device must remain completely still during this time. Long exposure photos may even come out brighter than you perceive the scene with your own eyes (LUX+ turns night into day).
Using LowLight Plus
How to switch to LowLight Plus camera mode:

1. Select Mode Switch

2. Swipe left and tap to select Camera Mode

1.) Tap the shutter button after setting up the shot. The **scene analysis** will automatically calculate the optimal number of photos necessary for a noise-free photo.

2.) After the scene analysis is complete, ProCamera will automatically capture the required number of photos. During the capturing process, a green **progress bar** is displayed at the top of the screen.

3.) You will see a **preview** of the completed LowLight Plus photo, which you may then confirm and save – or discard and go back to the viewfinder. Use the **toggle switch to compare** the standard photo (single exposure) with the LowLight Plus photo (multi-frame capture). Use the pinch gesture to zoom in and out or a double tap to jump to 100% view.

Saving the single exposure **reference photo**, as well as showing the preview screen, is optional and can be (de-)activated via Settings > LowLight Plus.

4.) While in preview screen, tap the **Magic Wand symbol** to (de-)activate the **auto image optimization** before saving the photo.
5. In very dark environments, you can tap the **LUX+** button to activate the powerful exposure boost (tripod/stabilization required).

The **LUX+ Exposure Boost Adjustment** provides an option to adjust the overall brightness after you have taken a LowLight Plus (LUX+) photo. The innovative slider is far more than a simple brightness adjustment tool, since it makes use of the full information space of the long exposure. Afterwards, the photo can be saved, resulting in a standard image file (JPEG/TIFF). “Get it right in camera” without worrying about setting the perfect exposure before taking the photo.

**Tip**

Use a tripod or your own creative stabilization method and a remote trigger (bluetooth trigger, headset, or ProCamera RemoteTrigger for the Apple Watch), to avoid even the smallest camera shakes.

If you plan to go on an extended photo taking trip, make sure to bring an additional battery pack („power bank“).

In very dark environments, focusing will take longer than usual. It generally helps to focus on an object with clear contours. Optionally, you can also activate the manual focus via Settings > Focus and Exposure: „Manual Focus“ and „show lens position“.
In the **LowLight Plus** submenu, you’re able to make the following changes:

- When **Reference Photo** is deactivated, no LowLight photo will be saved along with the LowLight Plus photo.

- When **Auto Save** is activated, you will see one preview according to the preset you have selected after an image is taken and you can choose to save or discard the capture.

- If **Screen Dimming** is enabled, the screen will be dimmed during the capture process of long exposure photos, to prevent „light pollution“ caused by reflected light from the illuminated screen.
This section shows you how to use the Selfie Camera Mode in ProCamera – which lets you take selfies quickly and easily. With our innovative Skin Tone Front Flash faces are rendered beautifully – even in low light.
How to Switch to Selfie Camera Mode

1. Select Mode Switch

The Selfie Camera is a streamlined photo mode to enable quick and easy self-portraits. Given that the purpose of this camera mode is primarily to take selfies, it only uses the front camera (the one above the display of the iPhone).

To provide an intuitive way of composing your shot, the preview of the front facing camera is typically mirrored on smartphones – whereas the actual photo saved in your camera roll is not mirrored. In case you want to have an unmirrored preview in the viewfinder or to see how other people see you, simply tap on the top right Front/Back Camera switch.

To be ready in no time to take your selfie, you can launch ProCamera directly in Selfie Mode via Today Widget. Pull down the Notification Center at any time and tap on the Selfie Camera Icon in the ProCamera widget (see chapter 4 for more).

The Selfie Camera comes with an innovative Skin Tone Front Flash. To illuminate your face, the screen of your iPhone will flash when taking a photo (the front camera on the iPhone has no actual build-in flash). To achieve natural skin tones, the color of the front flash will be automatically adjusted depending on the tone of the scene.
This section shows you how to turn on and use the Video mode in ProCamera including the Control Panel and advanced Video Settings.
How to Switch to Video Camera Mode

1. Select Camera Switch

2. Swipe left and tap to select Video Camera Mode

3. Set Framerate and Advanced Settings in the Control Panel

The Flash/Torch, White Balance, Front/Back Camera, Main Shutter Button, Light Box and Focus and Exposure controls operate the same way as in the Photo and Night Mode.

The **Secondary Shutter** button enables you to capture photo stills while recording video. Photos are saved at native video resolution (e.g. 1920 x 1080 pixels).
The Video Control Panel contains dedicated options for better recording. They are outlined below.

You can choose between four different resolutions depending on your needs. There are two additional modes that provide high resolution in combination with high frame rates (HFR):

A) 4K (Ultra HD): 3840 x 2160 (bis 30 fps)
B) HD+ HFR: 1920 x 1080
C) HD HFR: 1280 x 720
D) HD+: 1920 x 1080
E) HD: 1280 x 720
F) HQ: 640 x 480

Framerate sets the number of frames captured per second when recording. Framerate options vary across devices:

A) 24, 25, 30, 60 fps on iPhone 5 or newer
B) Up to 120 fps on 5S or newer
C) Up to 240 fps on 6/6Plus/ or newer

Note

ProCamera can playback high framerate footage captured in slow motion.
The advanced **Video Settings** are explained below

**Video Focus Mode:** Turn on Continuous Focus to automatically adjust focus while recording video. Turn off Continuous Focus to manually adjust and lock focus when recording.

Turn on for automatic **Video Stabilization.**

Allows you to turn off the **Video Zoom** control on both the front and back cameras (if available). On iPhone 4 and 4S non-zoomed video saves faster than zoomed-in video. HD video zoom requires approximately 50 seconds of post-processing for every minute of recorded video.

When „Audiometer“ is activated, the top bar of the capture screen will provide information on the current microphone input volume level in the form of colored square dots.
In addition to taking photos and videos ProCamera can also read QR codes, barcodes and more. Whether URL, address, GPS or product info – ProCamera recognizes the content type automatically and offers suitable actions to use the recognized codes in other apps or for online search.
Once scanner mode is switched on, ProCamera automatically recognizes any readable code you lined up inside the squared viewfinder. (You don’t have to press a shutter button.) ProCamera will then display the result screen.

Back to the mode that was selected last.

The Steady Light (top-left corner) can also be turned on to assist with scanning in low-light conditions.
Result Screen

Once scanned, you can automatically open the web URL, copy, paste or share the link or use one of the context-sensitive options depending on the type of code (e.g. address book vCard). Additionally, ProCamera gives you the option to directly search for a book on Amazon. Just scan the bar code on the book and tap on “Search on Amazon”.

ProCamera’s code scanner reads more than 10 types of codes. A sample of the type will appear at the top of the result screen. Codes can include various types of data. Scanner mode distinguishes the following:

- URL
- Message
- Contact
- Phone
- Calendar
- Text
- Email
- Search
- Map
- WiFi
You can choose to save photos and videos in ProCamera’s Lightbox instead of the iOS Camera Roll. Files that are saved inside the Lightbox are not visible in the „Photos“ app or other applications. It’s particularly suitable for narrowing down the choice, before exporting to the Camera Roll.

Back to table of contents
Album and Lightbox Functions are listed below

< Albums

Provides access to your Photo Library, including Camera Roll, saved albums and Lightbox. The Lightbox is always located second on the Albums list.

In thumbnail view the Multi-Select tool allows you to select multiple photos and videos to share, export or delete.

The Select All icon appears if the Multi-Select tool is turned on. This tool selects all photos, videos and animated GIF in the album. Perfect for mass saving or deleting of photos.

Camera returns to Photo/Video capture mode.

The following gestures can be used to navigate within an album/Lightbox.

**Single image view:**

A) Double-tap to zoom in or out on a photo.

B) Two-finger pinch to zoom in or out on a photo.

C) To copy to clipboard, long tap a photo preview until a „copy“ option appears.

**Media thumb view:**

A) When Multi-Select is active, you can de/select multiple images with a swipe gesture or by tapping on the images.

B) If your iPhone supports 3D Touch, you can force-push on the thumbnail images to see a quick preview.
ProCamera stores all Exif data for your photos (e.g. date, time, location, exposure, aperture and ISO value). View the photo’s metadata by tapping the Info button. ProCamera displays where the photo was taken and which cardinal direction the camera was facing (only available for photos which contain compass orientation and GPS data).

Tap the red dot in **Fullscreen map view** to show the photo’s location in your Maps app.
Use Lightbox

The ProCamera Lightbox can be found in the Settings as the first topic. (Settings are accessed from the Control Panel). When activated (highlighted with green color), ProCamera saves photos and videos to a dedicated “Lightbox” album in the app.

⚠️ CAUTION. Please ensure that you export any Lightbox photos to the Camera Roll before you delete ProCamera. Otherwise they will be deleted along with the app.
This chapter describes how to use the editing tools in ProCamera. The ProCamera Studio is divided into 4 sections, which include filters, tools, effects and advanced cropping.
The Editing Suite can be accessed by selecting “Edit” in single image view. There are four editing studios available.

**Filters** has 66 free and 14 paid filters. Swipe through to see the dynamic filter on your image. Swiping up/down on the image adjusts the intensity of the filter. Dedicated filter packs, including the paid ‘San Fran’ pack are shown below the filters.

**Tools** has image tools to adjust brightness, contrast, exposure, color saturation, color temperature, vignette, sharpen, boost, shadows and highlights.

**Lab** give you the power to alter the colors in your photos to create a more vivid appearance or artistic effects. They allow you to create your own style. The Vignette tool is now to be found in the Magic Tools.

Swiping up/down on the photo controls the amount of adjustment applied. Tapping once on the photo resets the adjustment.

**Cut** lets you crop, straighten and rotate your image. When one of these sub-functions is activated, you can return to the general ProCut overview with the “Back”-button. To crop, move the corners on the crop rectangle. A double-tap resets the crop.

Via **Straighten** you can adjust the photo steplessly. A double tap on the scale will restore the original state.

**Aspect Ratio** lets you select one of five presets (1:1, 3:2, 4:3, 16:9, 5:4, φ:1). A second tap switches the aspect ratio preview from portrait to landscape mode.

**Flip** rotates your photo 90° (left or right) or flips the photo (horizontally and vertically).
When editing a **RAW photo**, special tools will be available. Saving will produce a JPEG file. RAW files always remain unaltered.
This section shows you how you can share your photos through ProCamera
The images below show a selection of the apps and services available for exporting or sharing your captures. The apps and services that appear on your iPhone depend on which apps you have installed. ProCamera will export photos and videos in full resolution (including existing geotags), provided that the app or service you are exporting to accepts and handles those kind of files.

Using the **Export Menu**, you can share mobile-friendly versions of your files: Choose file size (Original, Large, Medium, Small), convert TIFF to JPEG, and/or remove existing geotags. You open the Export Menu via long tap on the sharing icon (bottom left) or by tapping on the export summary box above the displayed apps and services.

Your export preferences (size, remove geotag, etc.) are saved for your convenience. Each time a new photo/video is shared, the “next” button of the export settings must be pushed in order to apply your preferences. This prevents you from accidentally exporting your files with the wrong settings.
ProCamera can share to the following services:

- **Message**
  - Inserts your photo directly into an email or text. You can attach up to five photos at one time into emails. Even videos saved in your Lightbox can be sent this way. Videos saved in your Camera Roll will be compressed when shared via Mail or Message.

- **Twitter**
  - Share to one or more social networks, including Facebook, Flickr and Twitter.

  Via Settings > More > Social Tag you can define a default tag for sharing photos on Twitter, Facebook and Instagram. You can always change or extend this text manually when uploading your photo.

- **Vimeo**
  - Share videos to Vimeo.

- **Instagram**
  - Our dedicated SquarePrepare function lets you upload non-square photos into Instagram by adding bars along the edges. It also lets you snap to edges and resize within the frame.

- **Dropbox**
  - You can share single and multiple images and videos to Dropbox, allowing you to backup your photos to the cloud.

- **EyeEm**
  - Share your photos to EyeEm.
Print your photos wirelessly with compatible AirPrint printers and retail services.

Use Open in to transfer your photos to other apps for further editing or sharing. Photos will be transferred in the file format they are saved.

ProCamera offers the option to directly send an image file from within the app to the desktop version of Adobe Photoshop or Adobe Illustrator. You can also transfer a photo directly to your Creative Cloud account, which will make it available on your desktop computer(s).
General Options

This section explains the General Options section of the Settings

Back to table of contents
The **General Options** are listed below.

**Geo-tagging**: Turn on/off the ability to automatically save GPS photo data.

It’s possible to use the **Volume Buttons** on your device or on your headphones to trigger the shutter release. To activate this function go to Settings (General Options) > Volume Buttons. ProCamera generally provides the capability to trigger the shutter release via Bluetooth, as long as the utilized device emulates headphones.

**System Sounds**: Turn on/off the ProCamera sounds.

**Copyright (Exif)**: Enter text to embed Copyright information in photo and video metadata (Exif).
Troubleshooting

This section addresses common user questions and issues with ProCamera. If you have any problems or find a bug please use the Feedback/Support function in the Settings.

Back to table of contents
1. I neither see my last photo, nor the flash symbol, nor the front/rear camera switch. How do I restore the original design?

You have either activated “Medium” or “Light” mode. Tap on this icon in the control panel to leave this reduced mode.

2. Is it possible to trigger the shutter release via Bluetooth?

ProCamera generally provides the capability to trigger the shutter release via Bluetooth, as long as the utilized device emulates headphones. Under Settings > General Options “Volume Buttons” has to be activated.

If you have any other questions or would like to provide feedback then please use the Support & Feedback option in the ProCamera Settings. We now provide the option to send screenshots and photos along with your message.
